

The Ridgewood Rent Premium

Saturday, September 26 · Start: Seneca Ave & Palmetto St

Walk 15 minutes out. Then turn around.

Not to a destination — to a time. Everyone covers about the same ground, and everyone gets back here together.

Walk No. 04 — 15 minutes out, then turn around
Shaded: everywhere reachable on foot in 15 min, along real streets. Red: M-only stations, with median rent nearby.

On your walk you make three predictions about rent: one in the first minute, one around minutes 7–10, one around minutes 12–15, just before you turn around.

WEST

Down Seneca Ave → Grover Cleveland Park → right on Hart St,
out to the intersections.

Walk 15 minutes out. Then turn around.

Your three predictions

What does a typical apartment rent for, right where you are standing?

When	Where you are	Your guess	Actual	Off by
First minute				
Minutes 7-10				
Minutes 12-15				

No looking anything up. The only hint you get: Ridgewood is an
up-and-coming neighborhood.

What we found

Fill this in together, once everyone is back.

Rent falls about _____ % per minute you walk away from an M-only station.

Plot your three guesses

Minutes walked, against the rent you guessed.

Then we put everyone's guesses on one chart against the model — four directions, same fifteen minutes.

Try it yourself, on your phone:

What the premium adds up to

Within a 20-minute walk of an M-only station, the average renter household pays about \$96 a month more than they would 20 minutes out. There are 69,047 such households. That is roughly \$79 million a year in rent attributable to being near these stations.

The MTA collects the fare.

Compared to living 20 minutes away — the comparison is the number.

If proximity to a subway station generates a premium, who captures it?

The analysis behind this walk — every number, every judgment call — is public:
